Workflow Audit & Recommendations

Larissa-perspective walkthrough of the live production app — what works, what's missing, and where to invest next. Print and mark up.

Executive summary

The platform is far more built-out than a fresh look suggests. The dashboard milestone cards, daily platform syncs, RETS ingestion, AI Coach, the new Owner Story system, view tracking, and FB/IG auto-publish are all real and working. Larissa has a usable five-tab workflow on day one.

The gaps are not in what's built — they're in the *connectors between built things*. Posts go live but agents aren't notified to reshare. TikTok publishing is manual while FB/IG aren't. Status flips (UC, Sold) don't trigger a celebration-post prompt. The Owner Story is now visible everywhere but still has to be sent manually (no Resend wired). The next phase of work is plumbing the last 10 feet of every loop, not building new surfaces.

The single highest-ROI thing not yet built

Agent-notification-on-publish. Every time Larissa publishes a post about an agent's listing, that agent should automatically get a text or email with the post links and a one-line CTA to reshare it. The data is already there (*agent_email*, *agent_name* on every property). Without this, the network effect of agent resharing is left on the table on every single post.

Live walkthrough — what I actually saw

Morning arrival — Dashboard

Larissa lands on a strong opening screen. From top to bottom: company analytics strip (reach, engagement, engagement rate, posts published, followers) with sparklines and vs-prior-period deltas; sync health bar showing platform freshness; office filter chips; four collapsible milestone cards with 24-hour "fresh" badges (Recently Listed, Open Houses, Under Contract, Recently Sold); then the post-group stream below.

✓ Milestones-grid layout is excellent — one screen answers "what's new overnight."

✓ Office filter chips let her scope quickly to any of 8 offices.

✓ Sync health row tells her at a glance if any platform is stale.

! The four milestone cards are *collapsible* with badges — but they all start collapsed. She has to expand each one to see what's new. A single "this morning" one-line summary above ("2 new listings, 6 OHs this week, 1 UC, 1 Sold") would close the cognitive loop in one glance — especially for ADHD context-switching.

✗ **No "build a post about this" prompt on Under Contract or Recently Sold cards.** When a listing flips status, the system knows immediately (status_changed_at timestamp is maintained), but nothing nudges Larissa to make a celebration post. UC and Sold posts are some of the highest-engagement content Alliance produces.

✗ **Open House cards don't link directly to "build OH promo post."** Larissa has to click into the listing, then click into Post Builder, then re-select the listing. A one-click "Build OH post" from the OH row would save real time.

Owner Stories index — /stories

New top-nav surface (Phase 4 build). Every listing has a row with status pill, view count, story URL path, and Copy + Open buttons. Search by address/MLS/agent, filter by status, sort by activity/views/newest/address.

✓ Clean, scannable. Larissa can copy any link in two clicks from anywhere in the app.

✓ Status pills make UC and Sold listings stand out.

! **Duplicate-looking entries.** "117 E Maple Avenue" appears twice (one with "Judith Suder", one with all-caps "JUDITH SUDER"); "511 E 11th Avenue" appears twice at \$325,000 and \$319,000. Could be legit units, could be a dedupe gap in the RETS pipeline — worth a 30-minute investigation.

✗ **No bulk actions.** If Larissa wants to email five sellers their story links at once, she does it one at a time. Bulk-copy or bulk-email would be small to add and useful.

Owner Story public page — /home/[token]

Tested the live story for 220 Village Road. Renders cleanly: hero photo, address, facts strip (beds · baths · price · type), agent block with initials medallion, horizontal photo gallery, "Just Listed" chapter for zero-post listings, footer.

✓ Story page is genuinely beautiful — owners will not be embarrassed to share this.

✓ Photo gallery + facts strip make it feel like THEIR home, not a report template.

✓ Status-adaptive copy works — freshly-listed text is warm and present-tense.

✗ **The "Text or email [agent]" button does not render when agent_email is null.** On 220 Village Road, John J. Koch is the listed agent but the email is missing, so the seller's "What now" section is reduced to just "Share this page with family." Need to audit how many properties have null agent_email — this is a silent feature degradation.

✗ **No way to email the agent's phone number either** — even if agent_phone existed, the page only shows email. Should add tap-to-text (sms: URI) for mobile sellers.

Property detail — /properties/[mls]

After Phase 4, the Owner Story admin card is the dominant element directly under the listing hero, with the legacy Compass report demoted to a small footnote-style block at the bottom. Personal note autosaves, copy-link + open-preview both work, and view stats surface in a green activity banner once anyone has opened the page.

- ✓ Hierarchy now matches the design intent — story first, legacy last.
- ✓ View tracking lights up green the moment a seller opens the link — strong psychological hook.
- ! **SendToAgentButton is now buried.** The mailto-driven "Send to listing agent" button still exists but lives inside the demoted legacy Compass block, which is at the bottom of the page. It also still points at the OLD /r/[token] flyer URL. Worth re-pointing to /home/[token] and surfacing it next to the Owner Story card.

Reports — /reports

Company analytics hero with reach delivered, properties covered, view rate, plus a 90-day stripe and Recent Deliveries table. Cleaner since Phase 4 moved the story index out — /reports stays focused on aggregate analytics now.

- ✓ Right scope — aggregate analytics, not item-level management.
- ! Recipients/cadence panel is wired but waiting on Resend. The deliveries pipeline exists end-to-end except for the actual sending step.

Coach — /coach

Five sub-surfaces: intro card, plan generator (Claude Opus per call), spend recommendations (cached daily via Vercel cron), per-listing weekly budgets, trend watch (math-only). Real product, real surface.

- ✓ AI is genuinely doing work here, not decoration.
- ! Spend recommendations exist but Promotions/boosting is still "coming soon" in the UI (the rocket icon on group cards). The recommendation surface is ready before the execution surface — worth deciding if you're closing that gap or repositioning the recommendation as advisory-only.

Critical gaps

These are the five things Larissa's daily workflow currently can't do, ranked by the cost of not having them.

1. Agents are not notified when their listing gets a post

The single highest-leverage missing piece. When Larissa publishes a post about an agent's listing, the agent has no idea unless they happen to follow the Alliance accounts and see it organically. They can't reshare to their own sphere, can't thank Larissa, can't forward to the seller. Every post that goes out is a missed amplification opportunity.

What exists: agent_email and agent_name on every property; a manual SendToAgentButton with mailto that's now buried; an unused *notifications* table in the schema.

What's missing: the automatic trigger after publish — drop a row into the notifications table, send a templated email/SMS, and surface a confirmation in the UI. Half a day of work.

2. TikTok publishing is manual; FB and IG are automatic

The publish API route only supports facebook and instagram. TikTok requires a different upload flow (video-first, sandboxed direct-post API). For now Larissa saves the asset from Studio and manually uploads to TikTok. Asymmetric automation is friction every single post.

3. Status flips don't trigger posting prompts

Paragon flips a listing to Pending or Sold; the Owner Story page reframes itself automatically (Phase 1 behavior), but nothing prompts Larissa to celebrate the win publicly. UC and Sold posts are some of the most-engaging Alliance content — and missing them lets the brokerage's recruiting moat shrink. status_changed_at is already on the properties table.

4. Owner Story delivery is still manual

Every other piece is polished: the link exists, the page is beautiful, view tracking is live, the index is clean. But Larissa still has to copy the URL and paste it into Gmail or Messages. The Recipients/cadence panel is wired and waiting for Resend. The smallest fix is a mailto: button on the OwnerStoryAdminCard; the real fix is Resend.

5. Open House and "needs a post" prompts are passive

The dashboard surfaces "3 listings need coverage" and "6 OHs this week" — but each one requires Larissa to manually decide and click into Post Builder. A "Build OH promo post" button directly on the OH row (with the listing pre-selected) would shave seconds off every post and lower the activation energy for low-priority ones that today get skipped.

Prioritized recommendations

Top six items, ordered by ROI ÷ effort. Anything not on this list is polish or speculation. Mark up as you read.

#1 Agent-notification-on-publish

After `/api/post-builder/post` succeeds, fire a templated email to *properties.agent_email* with the post links and a one-line "share this on your story" CTA. Also insert a row into the existing *notifications* table so we can build an in-app agent inbox later. Largest unlocked ROI in the system.

Effort: Half day · Impact: Very high — closes the amplification loop

#2 TikTok publishing parity with FB/IG

Add a TikTok branch to `/api/post-builder/post` using the Direct Post API. Same publish UI, three checkboxes instead of two. Removes a manual step from every single post Larissa makes.

Effort: 1–2 days · Impact: High — removes friction from every publish

#3 Status-flip → celebration post prompts

Query properties where `status_changed_at > now() - interval '3 days'` AND status IN ('pending','sold'). Surface as a card on the dashboard: "5 wins to celebrate" with one-click drafts in Post Builder pre-populated with the listing. Recovers ~3–5 high-engagement posts per week that currently slip through.

Effort: 1 day · Impact: High — recurring revenue post type

#4 Owner Story delivery — Resend wiring

Wire the existing Recipients/cadence panel to Resend. The data layer is built; this is plumbing. Two intermediate stops along the way: (a) ship a `mailto:` button on the `OwnerStoryAdminCard` *today* so manual send takes one click instead of three, (b) ship Resend properly when ready.

Effort: Half day (`mailto`) + half day (Resend) · Impact: High — completes the primary output loop

#5 Morning-briefing summary card on Dashboard

One-line summary above the four milestone cards: "Overnight: 2 new listings, 1 UC, 6 OHs this week, 3 stories opened by sellers." Click any token to expand the corresponding card. Cognitive saving for ADHD context-switching at the start of the day.

Effort: 2–3 hours · **Impact:** Medium-high — daily quality-of-life

#6 One-click "Build post" from Open House row

On the Upcoming Open Houses card, each OH row gets a "Build OH promo post" button that opens Post Builder with the listing + open_house template pre-selected. Lowers activation energy for low-priority OH posts that get skipped today.

Effort: 3–4 hours · **Impact:** Medium — recurring weekly content

Quick wins — half-day or less each

Independent of the prioritized list above, these are small fixes that punch above their weight.

- **Re-point SendToAgentButton.** Currently buried in the legacy Compass block AND points at `/r/[token]`. Move it next to the Owner Story card and re-point at `/home/[token]`.
- **Audit null agent_email values.** The "Text or email agent" CTA silently disappears when `agent_email` is null. Surface a warning on the property detail page if missing, with a quick-fix input.
- **Investigate duplicate listings on /stories.** Some addresses (117 E Maple Avenue, 511 E 11th Avenue) appear twice. Confirm if legit units or dedupe gap.
- **Add agent_phone column to properties** and a tap-to-text (sms:) link on the Owner Story page. Many sellers prefer text; many agents respond faster to text.
- **Clarify Promote (coming soon).** The rocket icon on group cards is confusing because Coach *already* recommends spend. Either label as "Auto-boost — soon" or hide until built.
- **Story page: add agent headshot** when available. The initials medallion is fine but a real photo makes the owner page feel hand-crafted, not auto-generated.
- **Bulk-copy on /stories.** Shift-click rows, get a multi-line text block of links — saves time on "send the story to all sellers this week" batches.
- **Add an "Agent Inbox" tab** (in a later phase) backed by the unused notifications table — a single place for agents to see every post Alliance has made about their listings, with reshare links.

Things already built that deserve more credit

Earlier in the conversation I underestimated how much was already in place. Re-stating for record:

- ✓ **FB + IG auto-publish.** `/api/post-builder/post` hits Meta Graph for both platforms in parallel and updates `posted_to/posted_at` on success.
- ✓ **Daily platform syncs.** `pg_cron` triggers `ig-sync`, `fb-sync`, `tt-sync` at 04:00 ET, 5 minutes apart, every morning. Independent of the 4-hour RETS sync.
- ✓ **Coach is real product.** Plan generator runs Claude Opus per call; spend recs and per-listing budgets cache daily; trend watch is math-only. Vercel cron refreshes the cached surfaces. Not a stub.
- ✓ **Auto-linker maps posts → properties** by MLS hashtag, full address, partial address. The `link_method` enum tracks which path matched. Cleaner attribution than most agencies can produce.
- ✓ **Multi-office aware throughout.** Office filter chips on the dashboard; `audience_scope` on every post group; office tagging on properties via `city/zip` → offices mapping.
- ✓ **Owner Story view tracking ships clean.** Fire-and-forget logging, RLS-protected, indexed for the admin-card stat query. Already running on every page render.

How I'd think about the next sprint

If you can only do one thing this week: **agent-notification-on-publish**. It directly closes the third core job of the platform ("get new post notifications out to Agents so they can share out"), which is currently entirely manual. Everything else is polish on already-strong surfaces.

If you can do three things: agent-notification, TikTok publish parity, and the status-flip celebration prompts. Those three together convert the platform from "strong dashboard" to "runs the playbook on its own."

If you can do five things: add the Resend wiring (Owner Story delivery) and the morning briefing card. Now Larissa starts each day with one screen of "what happened, what needs me" and ends each post-publish with the loop already closed downstream.

Prepared 2026-05-15 from a live walkthrough of the production app at *alliance-analytics.vercel.app*, combined with a codebase audit across 41 routes, 13 server-action modules, and 7 Supabase edge functions.
